

21.01. DHIS2 integration

DHIS2 is an open source data warehouse that can be used to store, aggregate and display Health data. mSupply can pushing data periodically to a DHIS2 instance. Before this can happen, the data to be sent and any calculations that need to be made will need to be configured.

Requisites

DHIS2 basically stores data values that have 3 dimensions:

- organisation unit → Place (customer/store in mSupply)
- data element → The type of data to be associated with the data
- Period → The historical time period associated with the data

With that DHIS2 has the power to show different types of data for different places of interest on various graphs. It can also aggregate those values in hierarchical groups.

Common types of data

1. Stock on hand
2. Stock expiring
3. Value of stock on hand
4. Critical items availability

mSupply connection to DHIS2

Now mSupply can be connected to DHIS2 using the preferences to enter de credentials:

In order to have a scheduler running to send data from mSupply to DHIS2 you first need to have a DHIS2 instance that has links with mSupply for each organisation unit and data element.

Contact our team to help you to create the specific data elements on DHIS2 accordingly with the data that you want to be sent. We will configure it for your specific situation. This has been done already for Laos and countries that are part of the [Tupaia](#) project including Kiribati, Tonga, Solomon Islands, Cook Islands, Vanuatu, with some more to come.
